

Areas PREPARATION FOR ROACH TREATMENTS

Kitchen Areas

Remove everything from cabinets and drawers.

Remove dishes individually and inspect each one for roaches that may be hiding.

Place contents of cabinets and drawers (but not the drawers themselves) in the center of the living room or dining room floor.

Discard any food that is opened.

Take the unopened food and place that on the living room floor also.

Bathrooms

Repeat the same procedure in the bathrooms.

Starting with the medicine cabinet, empty it and place the contents with the food and the dishes. Then empty the cabinet or vanity below the sink as well as the cabinets or pantries that would house towels, etc. Place these contents on the living room floor also.

Take a clean sheet or blanket and cover all the items that have been removed from the kitchens and baths.

Other/Animals

Do not leave out any food, pet bowls or pet food.

Place all your kids toys in closets or in plastic bags.

A baseboard application will be performed first, and then a fan spray of all the bases of the cabinets and finally the entire building will be fumigated.

Make arrangements for you and your pets to leave the premise for FOUR hours after the treatment. Special instructions apply to birds. All birds must be out for 8 hours. Fish tanks must be covered with a towel and the circulation pump must be disconnected. If you have saltwater fish, please contact our office for further instructions.

Most multi family dwellings are equipped with smoke detectors or similar devices. All of these sensors should be covered with plastic and secured with tape. The reason for covering these sensors is to prevent the fumigation process from setting them off. If tenants are not capable of covering these devices, our technicians will perform the task for an additional charge.

If you wish to wash out or vacuum your cabinets, please do so prior to our treatment, not after. Cleaning them afterwards will dilute the residual, causing the treatment to be unsuccessful. Please wait 30 days before washing the areas to which the product has been applied.
